

Claude integration guides

Step by step guide to make an AI work in the TS Platform

- [Claude setup guide](#)

Claude setup guide

1. Buy a subscription for Claude Code
2. Install Claude Code Desktop from <https://code.claude.com/docs/en/desktop>
3. Create or appoint a folder on your pc that Claude can have access to.

4. Somehow make sure that the Claude desktop app knows which folder this is. In the picture above the folder is named "claude"
5. Create a new usergroup in your TS application called "LLM". It MUST be called this.
6. Give the group the required permissions for your purpose.
7. Create a new user in your TS application with the new "LLM" group.
8. Make sure to log in yourself on the user so you have both username and password.
9. Navigate to the "Code" section in the Claude desktop app, and tell it to create an mcp connection to *TS Application url*/mcp, for example "https://alpha.tempusserva.dk/TempusServa/mcp"
10. Tell it that the authentication is type "Basic" along with the login credentials of the new user.
11. Close and restart Claude Desktop via menu > File > Exit
12. You should now be able to tell Claude to do stuff in the TS Application.
