A media file is composed of 4 attributes.

The name

Just the name shown in the dropdown, when selecting a component type for a page component.

The type

Is it an image or a video.

The content

An image or a video, based on the type selected.

An alt-text

The alt-text added to the HTML, that will be shown if the media fails to load, and will be used by screen readers.

A media file also has 2 system attributes.

The public path

A path to where this file is publicly available.

The alt public path

Only used for videos. A path where a thumbnail for this video is publicly available.

Media File

Status	Active ▼

Every time a media file is saved, the file is written to disk, and the public path is updated.

If the media is a video, then the video is also re-encoded into the defined resolutions and bitrates. This takes a while and therefore the site will be loading for a little while. A thumbnail is also generated, and that path is saved in the field "Alt Path".
