A redirect is composed of 2 attributes.

From

The url that a user accesses.

The part after `/p/`.

Can't contain a `?` and will only react to the part before the `?` of the url that a user accesses.

Eg. `/p/some-page?param=foobar`, will be seen as `some-page`.

To

The url that a user should be redirected to.

Can only be the part of the url that comes after `/p/`.
