Wrapping emails

It is possible to wrap all emails sent by the system in an MJML or HTML wrapper.

Our implementation of the MJML engine is a bit unstable, so it is recommended to build the wrapper using MJML, then exporting the HTML version and uploading that to the platform.

Two tags are available: `[SUBJECT]` and `[BODY]`

SUBJECT will be replaced with the subject of the given email.

BODY will be replaced with the email-content of the given email.

To enable email-wrapping, set the Policy `defaultEmailTemplateID` to the ID of the template.

You can control whether the content of the email is inserted into the template before or after rendering, via the Policy `emailDoInsertBeforeRender`.
