Parsing XML data files

XML fields are mapped to solution fields by xpath expressions.

XML integration also handles task splitting and handling. Each file is split into multiple smaller requests, that are logged and handled individually. In that way an error in a single line, will not prevent the complete batch from executing. The task split is done by an xpath expression.

Files are split in the following folder structure

- Tasks that are **awaiting** processing
- Tasks that have been processed
  - Tasks processed with **succes**
  - Tasks processed with **errors**

This allows for easy resubmission of problem data ("Tasks processed with errors"), by copying the file back to the preocessing folder ("Tasks awaiting processing").

Files have to be placed in the folder set by the configuration: **folderIntegrationXML**
