

AWS Server setup

Installing the server

1. Log into the AWS account
2. Choose an appropriate zone, eg. eu-north-a (Stockholm)
3. Navigate to the EC2-dashboard
4. Launch a new instance
 1. Give it a useful name
 2. Change the *Instance type*
 3. Select a keypair that you have access to
 4. Select "Select existing security group", select:
 1. WebAccess
 2. default
 3. DefaultSSHAcess
 5. Optional: Adjust storage
 6. Launch the isntance
5. Reserve a dedicated (elastic) IP address
 1. Click *Allocate elastic IP address*
 2. Click *Allocate*
6. Associate the elastic IP
 1. Find the IP in the list, click it
 2. Under *Actions* choose *Associate elastic IP address*
 3. Find the instance you just launched
7. SSH into the server and install the CLI
 1. Optionally run: `ts developer-access`
