

Setting up an Application Entity

Once you have identified the variable data in the document you can begin building the Application Entity to feed into the document or use an existing entity. Every field in a TS Application has a unique system name (all caps) e.g. **DATE**, **USER**, **WEIGHT**, etc. Each field name can be used as a “Field Token” by replacing variable data with the relevant Field Token. Example: `${DATE}` will insert the field value of “DATE” in the document.

Attach Template

When you have completed your template document with all the relevant Field Tokens and Sections markup you are ready to attach your template to the application entity.

Field remove manual edit assign translate siblings changes ☐

Type	Basic: Text ▼ 
Title	Name NAME usage
Configuration	Edit configurations 
Options	<input checked="" type="checkbox"/> Include field value in item Resume
Display	<input checked="" type="checkbox"/> Show by default in List views
	<input checked="" type="checkbox"/> Show by default in Lists of children on parent items
Validation	<input type="checkbox"/> Perform validation (optionally use onclick javascripts)
